

Appln. No. 09/992,816
Amendment dated Dec. 8, 2004
Reply to Office Action of Sep. 8, 2004
Docket No. BOC5-2001-0040 (285)

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the instant application:

Listing of Claims:

1. (Currently Amended) A method of dynamically displaying speech recognition system information comprising:

providing a single floating window for displaying frames of speech recognition system state information to a user; and

varying said frames according to trigger events detected in said speech recognition system, wherein each said frame differs from others of said frames according to said speech recognition system state information, wherein the frames variably displayed in the single floating window include a frame containing a list of valid speech recognition commands for a current speech recognition system state and a frame containing a list of alternative text selections for a previously spoken word for which a speech-recognition operation has been performed.

2. (Original) The method of claim 1, further comprising:

detecting a trigger event in said speech recognition system; and

responsive to said trigger event, dynamically updating said single floating window according to said trigger event.

3. (Original) The method of claim 2, wherein each of said trigger events specifies one of a plurality of context dependent frames.

Docket No. BOC-2001-0040 (285)

4. (Original) The method of claim 3, said updating step comprising:
changing said context dependent frame in said single floating window to a context dependent frame corresponding to said detected trigger event, wherein said context dependent frame includes selected items of speech recognition system state information.
5. (Original) The method of claim 4, further comprising:
determining at least one of said items of speech recognition system state information to be included in said context dependent frame corresponding to said detected trigger event.
6. (Original) The method of claim 5, wherein said trigger event is selected from the group consisting of a change in an operational state of said speech recognition system, a user selection of text in a primary view of said speech recognition system, a user command to initiate a function in said primary view, and a location of a pointer in said primary view.
7. (Currently Amended) The method of claim 5, wherein said selected items of speech recognition state information include ~~are selected from the group consisting of~~ a list of available speech commands, a list of alternate text selections, and a list of commands previously issued by a user.
8. (Currently Amended) A single graphical user interface configured to display all context dependent frames of selected items of speech recognition system state information in a speech recognition system, wherein said single graphical user interface is further configured to dynamically present selected ones of said plurality of context dependent frames responsive to at least one trigger event, wherein the context dependent

Docket No. BOC9-2001-0040 (285)

frames dynamically presented in the single graphical user interface include a frame containing a list of valid speech recognition commands for a current speech recognition system state and a frame containing a list of alternative text selections for a previously spoken word for which a speech-recognition operation has been performed.

9. (Currently amended) The graphical user interface of claim 8, wherein said selected items of speech recognition system state information ~~are selected from the group consisting of~~ include a list of available speech commands, a list of alternate text selections, and a list of commands previously issued by a user.

10. (Original) The graphical user interface of claim 8, wherein said trigger event is selected from the group consisting of a change in an operational state of a speech recognition system, a user selection of text, a user command, and a location of a pointer.

11. (Currently Amended) A speech recognition system having a primary view and a separate single graphical user interface configured to display all context dependent frames of selected items of speech recognition system state information in said speech recognition system, wherein said separate single graphical user interface is further configured to dynamically present selected ones of said plurality of context dependent frames responsive to at least one trigger event, wherein the context dependent frames presented in the separate single graphical user interface include a frame containing a list of valid speech recognition commands for a current speech recognition system state and a frame containing a list of alternative text selections for a previously spoken word for which a speech-recognition operation has been performed.

Docket No. BOC5-2001-0040 (285)

12. (Original) A machine-readable storage, having stored thereon a computer program having a plurality of code sections executable by a machine for causing the machine to perform the steps of:

providing a single floating window for displaying frames of speech recognition system state information to a user; and

varying said frames according to trigger events detected in said speech recognition system, wherein each said frame differs from others of said frames according to said speech recognition system state information, wherein the frames variably displayed in the single floating window include a frame containing a list of valid speech recognition commands for a current speech recognition system state and a frame containing a list of alternative text selections for a previously spoken word for which a speech-recognition operation has been performed.

13. (Original) The machine-readable storage of claim 12, said updating step comprising:

detecting a trigger event in said speech recognition system; and

responsive to said trigger event, dynamically updating said single floating window according to said trigger event.

14. (Original) The machine-readable storage of claim 13, wherein each of said trigger events specifies one of a plurality of context dependent frames.

15. (Original) The machine-readable storage of claim 14, said updating step comprising:

Docket No. BOC5-2001-0040 (285)

changing said context dependent frame in said single floating window to a context dependent frame corresponding to said detected trigger event, wherein said context dependent frame includes selected items of speech recognition system state information.

16. (Original) The machine-readable storage of claim 15, further comprising:
determining at least one of said items of speech recognition system state information to be included in said context dependent frame corresponding to said detected trigger event.

17. (Original) The machine-readable storage of claim 16, wherein said trigger event is selected from the group consisting of a change in an operational state of said speech recognition system, a user selection of text in a primary view of said speech recognition system, a user command to initiate a function in said primary view, and a location of a pointer in said primary view.

18. (Currently Amended) The machine-readable storage of claim 16, wherein said selected items of speech recognition system state information ~~are selected from the group consisting of a list of~~ include available speech commands, a list of alternate text selections, and a list of commands previously issued by a user.
